

Risk	Solution
Server Issues	Having backup sources that will be able to run if there are any problems found on the server side. This way no matter what happens we have an alternative way of running the site.
Compatibility issues (Javascript)	Making a warning message appear with specifics of how to fix the issue. For example if the user is using a browser with Javascript disabled, telling them the problem so that they know how to fix it if they please.
Software Issues (Programs/software not installed)	Having a README file in with the project that outlines all of the things that are needed in order to run and edit/test the project so any person is completely clear on what they have to do to use it.
Software Issues (Software crashing)	Having an included jar file in my GitHub means that you don't have to rely on software such as Eclipse and visual Studio code. You can run the basic functionality from the command line and a browser.
