

Risk	Solution
Inaccurate Estimations	This risk can be overcome by using Jira boards with story points to plan the work. This directly gets the team involved in how long they think it will take them to do work.
Poor Quality Code	This risk can be overcome by having a process in place that makes for reviews before code is pushed into the working branches on git hub. This allows other people to check the code or requires you to re look over your own work in order to notice errors.
Poor Productivity	This can be overcome by understanding how people work and working the way that works for you. Taking breaks and having time away from work so that when you are working it is time when you are fully focused ready to get the work done. Also using sprints on Jira Boards as it gives you a mini goal to aim for and will push yourself to get code done in time for the sprint.
Internet Issues	Having external places that you can work and not relying on one internet connection so if one goes down you can work elsewhere. Phone hotspots also can be a good alternative for a temporary fix.
PC Issues	Having a secondary computer that you can use if you need to will help if something out of your control happens.
